Turbulence forecasting · validation

Model: yalamanchi_vit | checkpoint epoch: 99

Training: five-step rollout, normalized MSE + 10 × relative KE error², horizon 5

Forecast: 10 recursive steps; no ground-truth resets

Start: file 451, frame 0, t=121.722496

End: t=122.022331 | elapsed simulation time: 0.299835

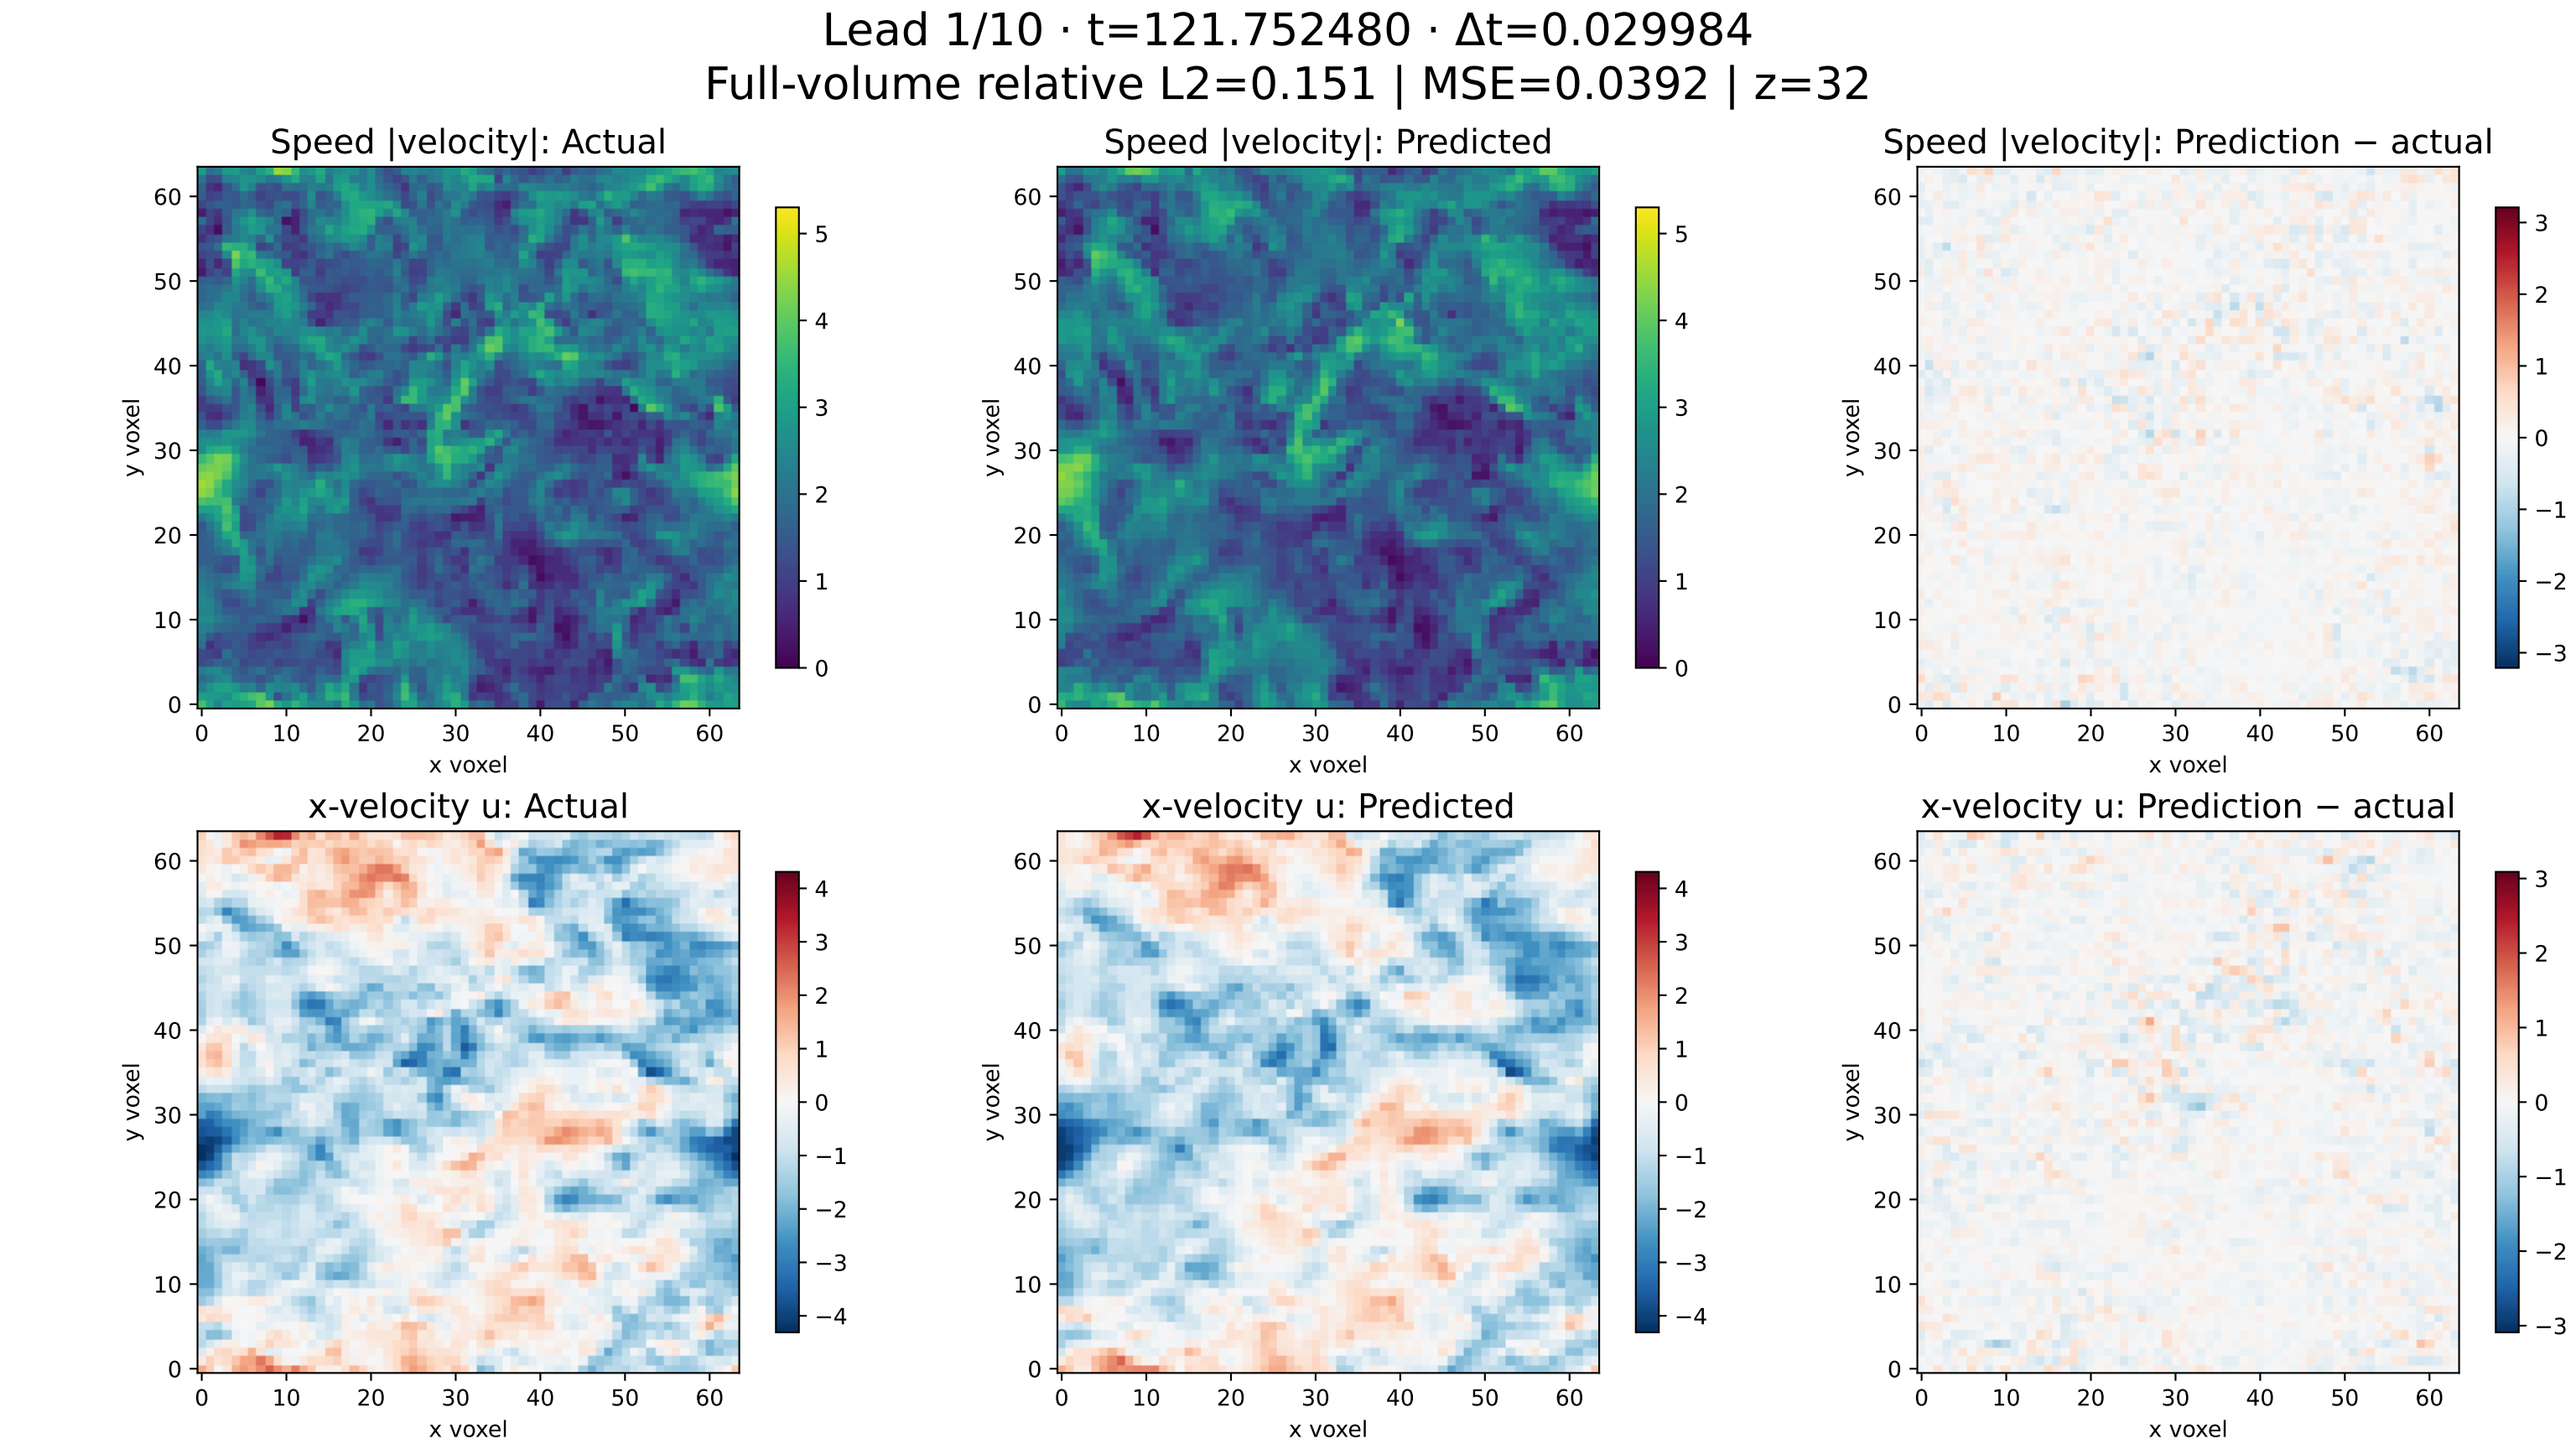

Filtered 64^3 velocity data | fixed z=32 slice

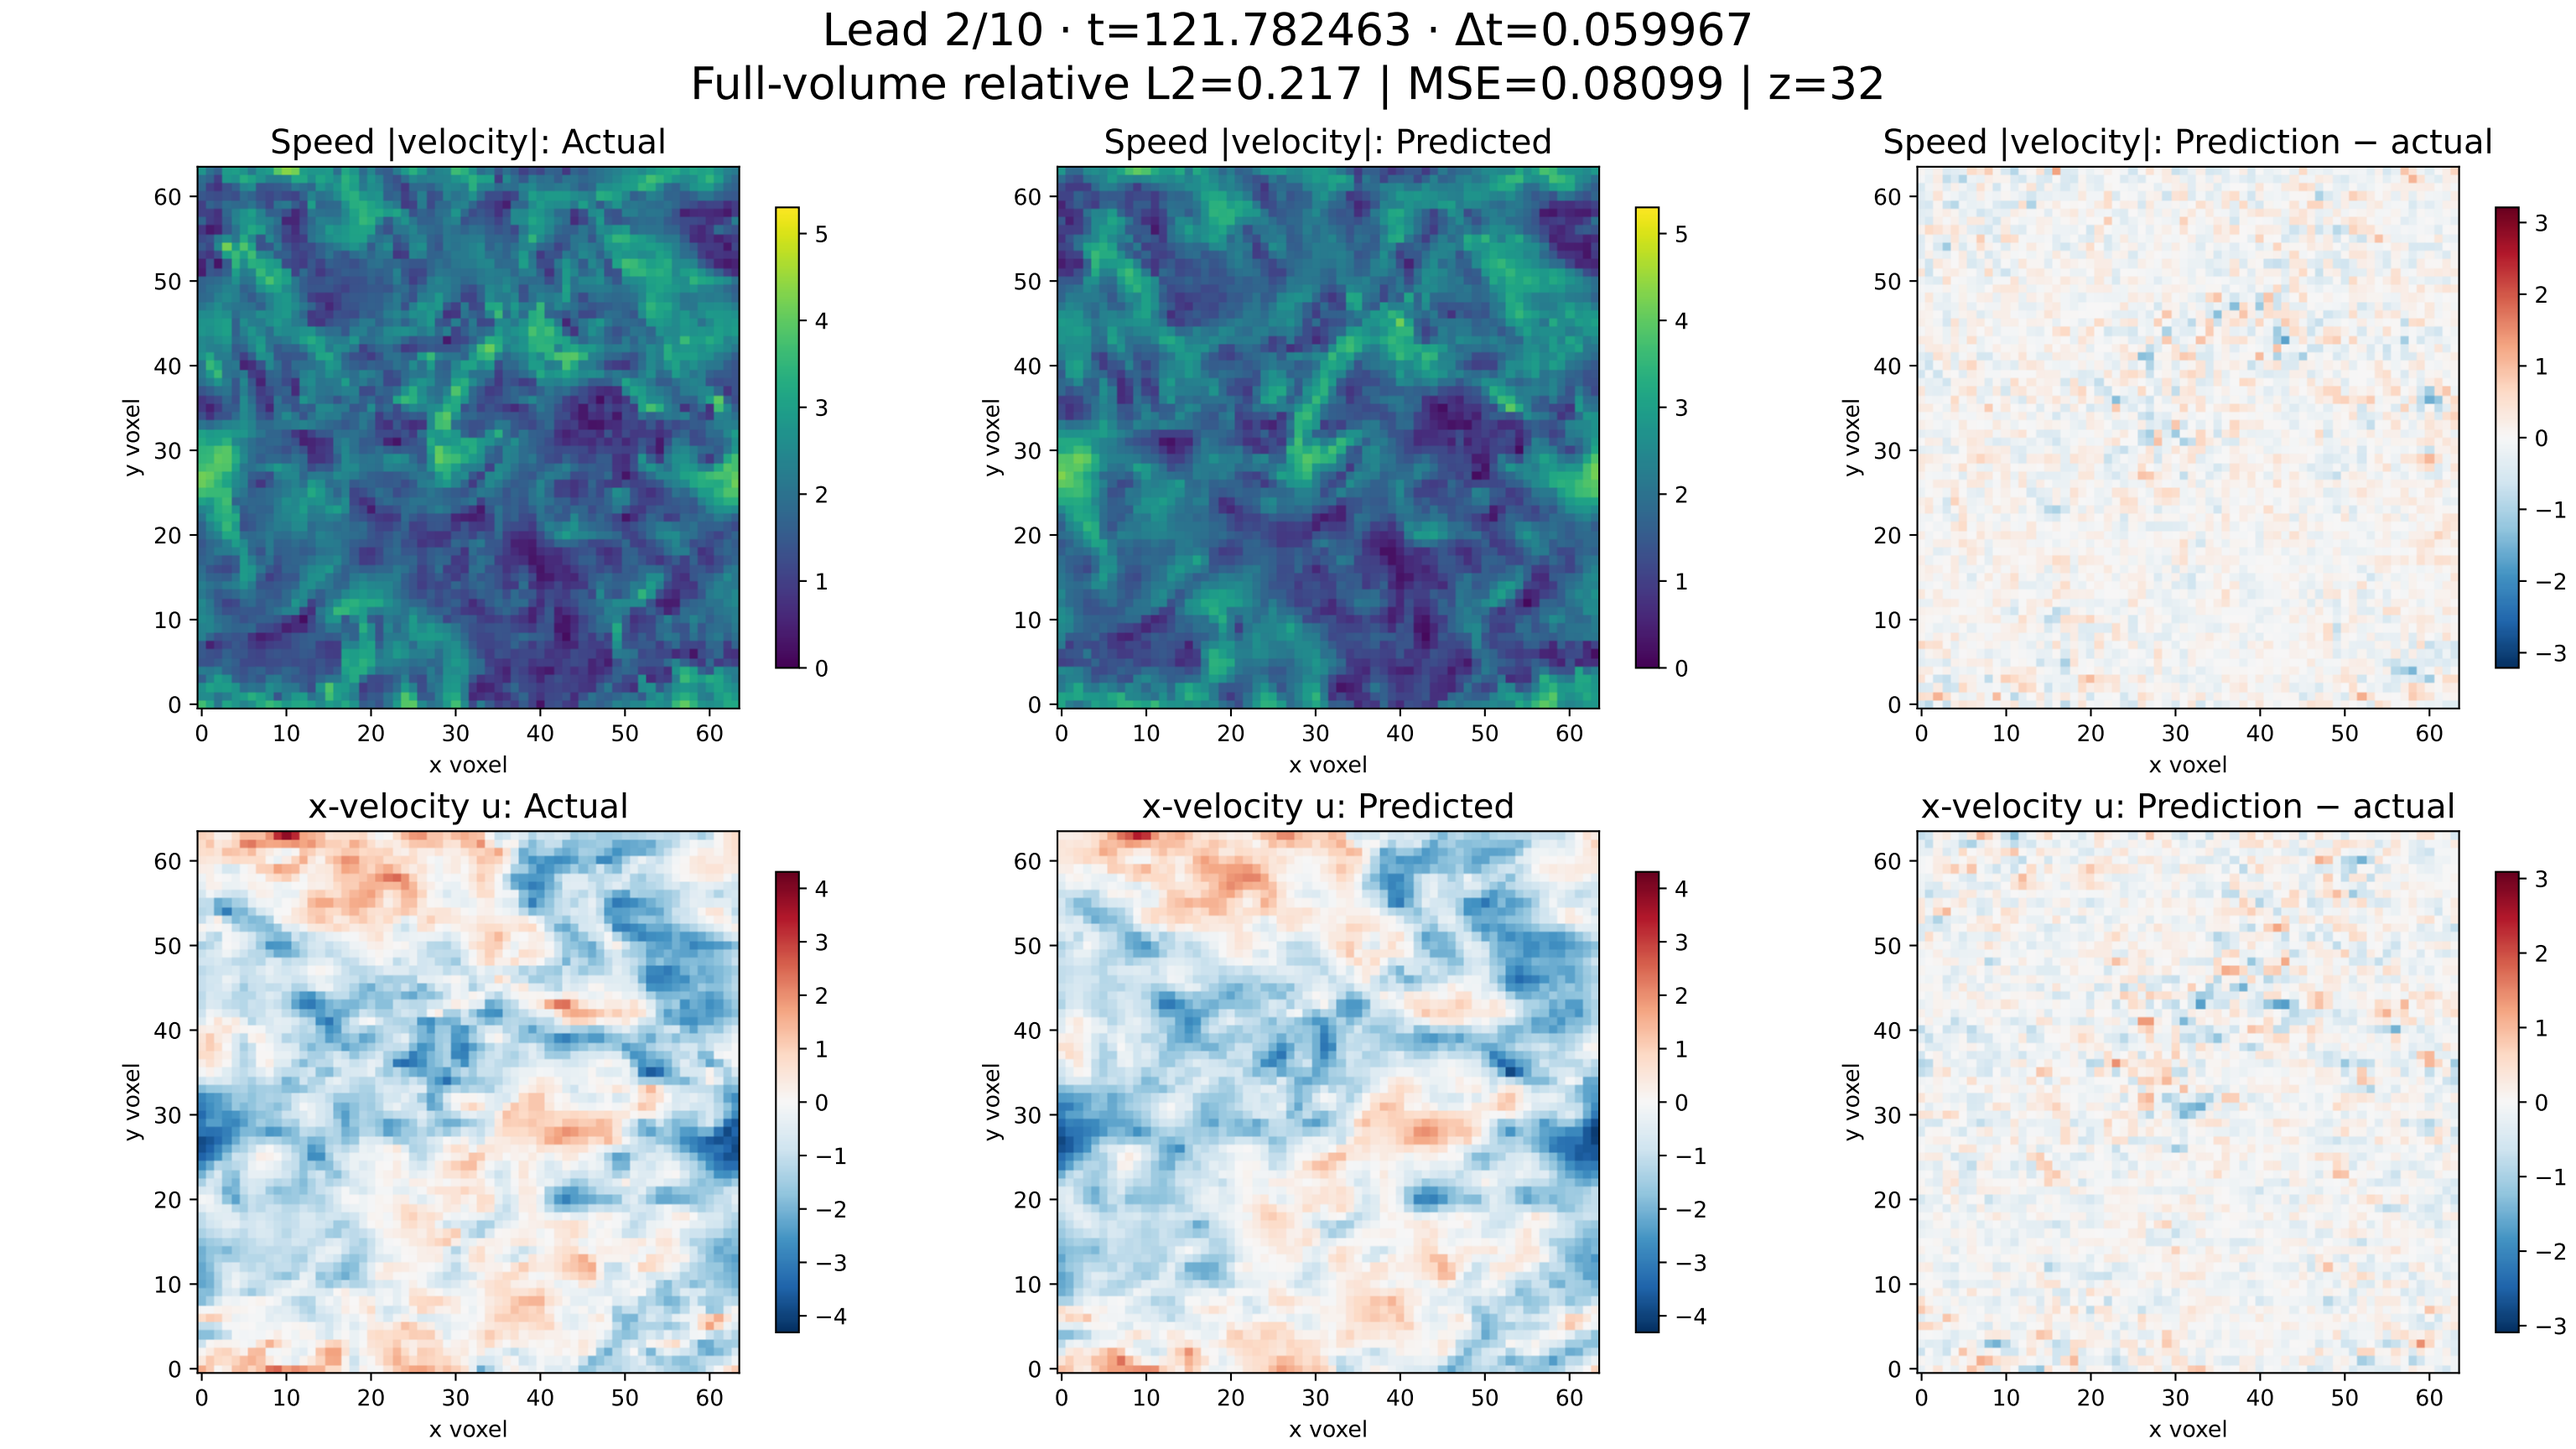

Fixed color scales across all leads; errors are prediction minus actual.

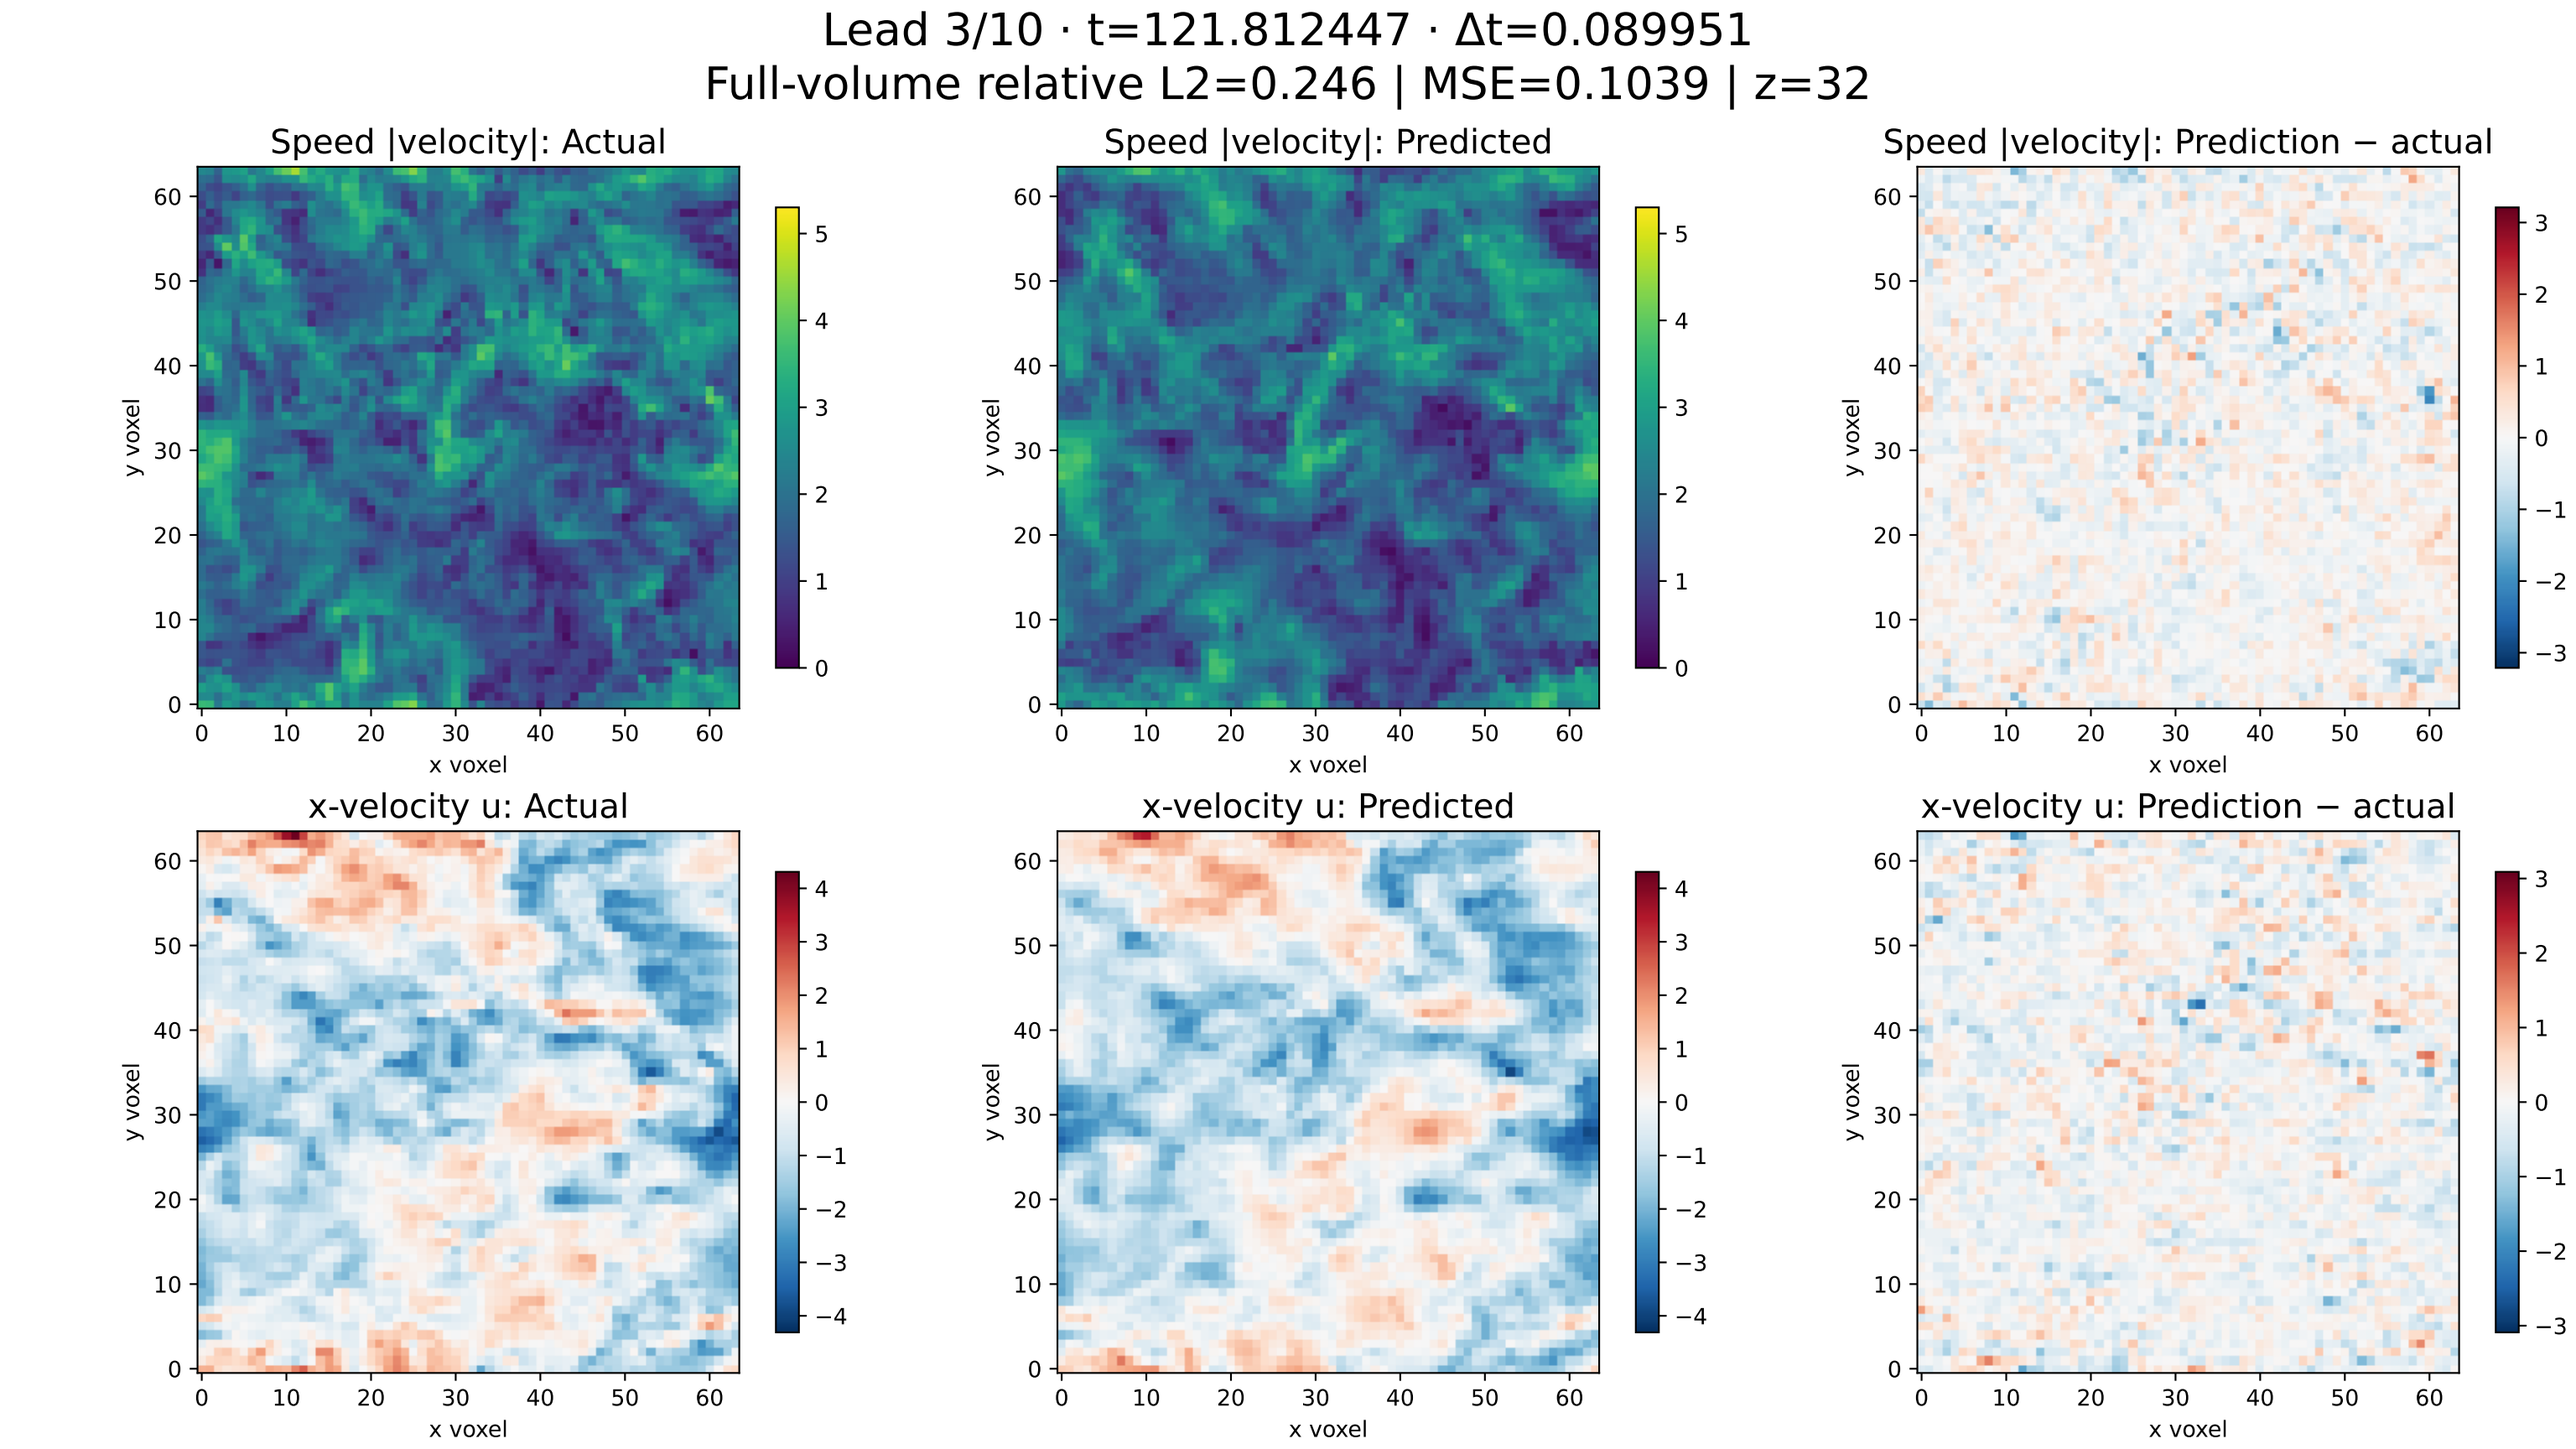

Field units are undocumented; metrics use original cached field values.

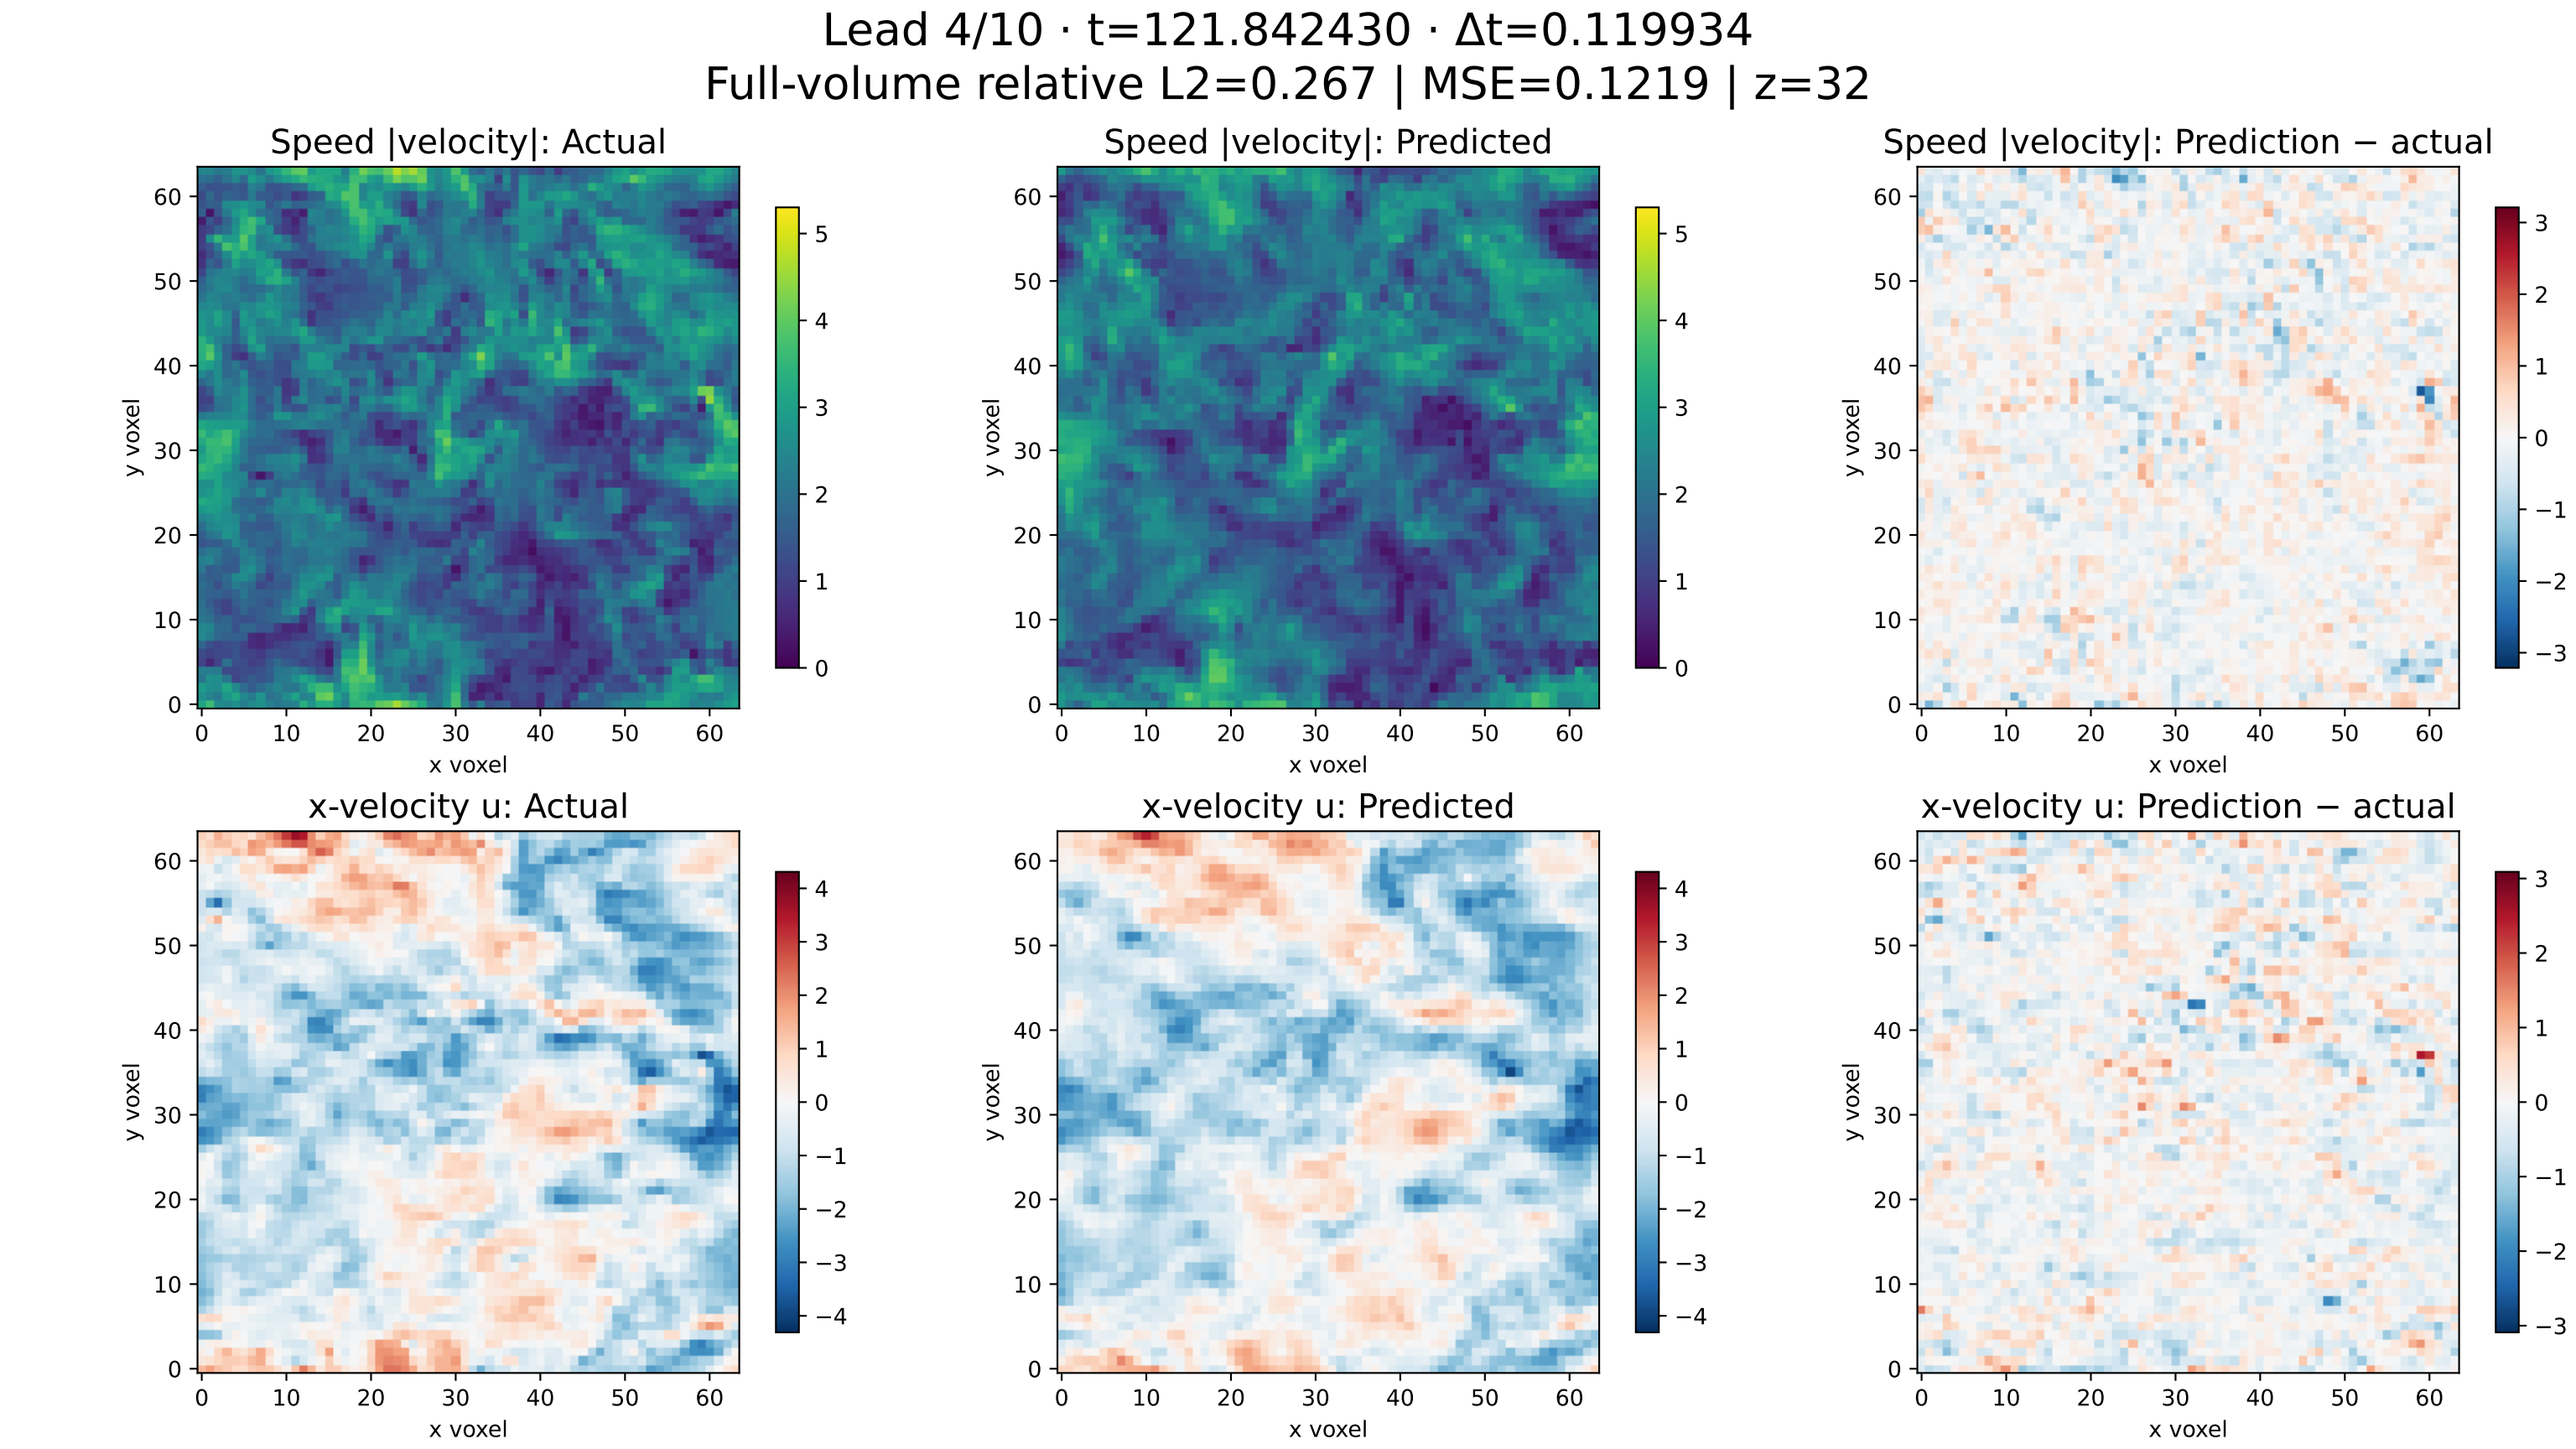

This trajectory is the first validation window, selected before evaluation.

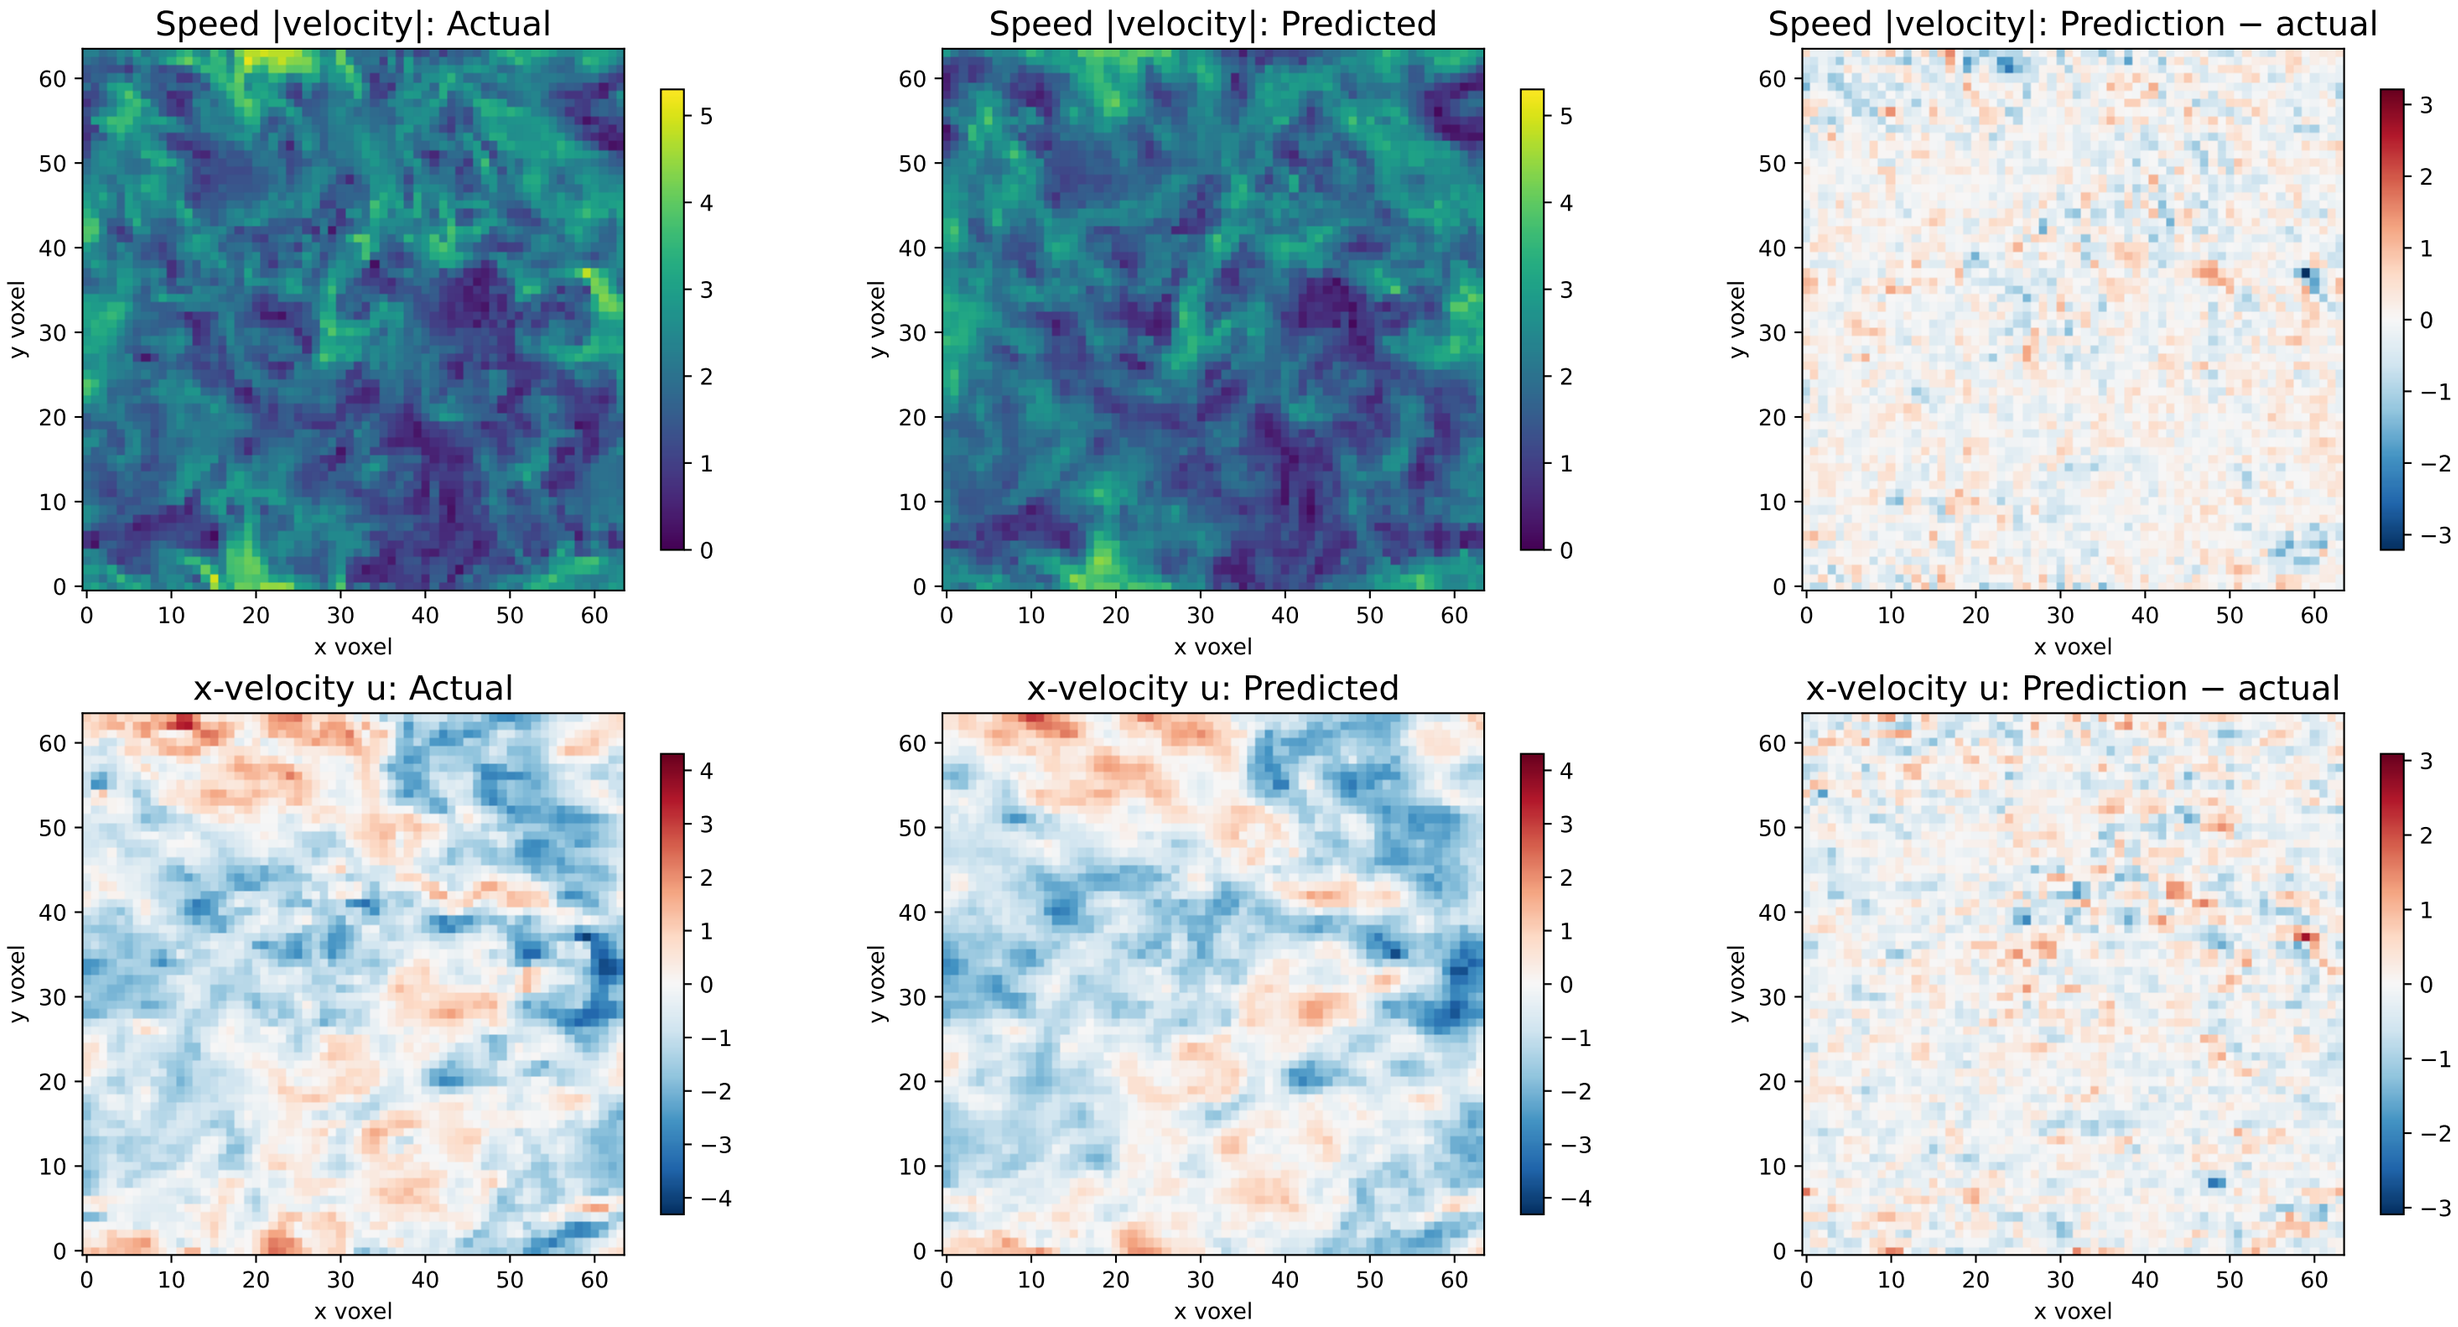

Validation was used for checkpoint selection; these are not independent test results.
